SUPERVISORY PATENT EXAMINER

Continuation of 11.

Applicant asserts that by a preponderance of the evidence one of skill in the art would not have sufficient motivation to combine 3Com® with Derocher, in that the teachings of 3Com® require a stylus for interaction with a touch surface whereas Derocher teaches finger interaction (and not stylus).

After careful consideration of Applicant's arguments, Examiner respectfully disagrees.

Derocher discloses a touch pad for a computing device, such as a hand-held computing device or similar computing resource (Derocher: col. 1, ln. 8-11; col. 2, ln. 32-34), wherein the touch pad presents the appearance and performs the functions of user-definable or "soft" keys (Derocher: col. 7, ln. 1-5).

While the examples throughout the reference detail and illustrate the presence of a user's finger to actuate a position on the touch pad, these teachings are merely exemplary and not limiting.

As one of ordinary skill in the art would ascertain from Derocher, a touch pad is disclosed with a light-emitting layer so as to actively illuminate the touch pad surface.

Derocher discloses expressly wherein the touch sensor of the touch pad incorporates capacitive or resistive surfaces to identify the location of contact on the touch pad surface (Derocher: col. 2, ln. 65 – col. 3, ln. 23).

Thus, the actuation of the touch surface is not limited to a finger given that capacitive and resistive touch pad technologies are capable of interacting with a plurality of input devices, including a stylus.

Moreover, the "hand-held computing device" of Derocher has a "touch pad which is used as a graphical input device that conveys user inputs which control the operations of the computing device" (Derocher: col. 1, ln. 8-11), and is therefore inclusive of the teachings of 3Com® which utilizes a stylus (e.g. user inputs) to control the operations of a hand-held computing device.

As such, it is the Examiner's position that by a preponderance of the evidence one of ordinary skill in the art would have sufficient motivation to combine 3Com® with Derocher, in that the teachings of 3Com® and Derocher are related to sensors of a touch surface that detect actuation by a stylus.

Continuation of 13. Other: An intialized copy of the Information Disclosure Statement filed 20 December 2006 is attached.
